1 Interaction Logs

An LLM(Gemini) was utilized as an AI assistant during this project. Its role was to provide clarification on technical dilemmas and to help troubleshoot complex implementation challenges. This log documents the key interactions.

1.1 Key Inquiries (Prompts)

The development process involved strategic inquiries posed to the AI assistant to resolve specific challenges. Representative prompts included:

- A request for a robust method to integrate a pre-trained classifier with a generative summarization model to form a cohesive AI agent.
- An inquiry into best practices for converting the agent's simulated input into a real-world application by connecting to the Gmail API.
- A query on resolving persistent `API_KEY_INVALID` errors, seeking a systematic troubleshooting approach.
- Technical assistance in debugging LaTeX for report generation, specifically for resolving package conflicts and controlling figure placement.

1.2 Summary of Technical Consultation

The consultation can be summarized in the following key stages:

- **Architectural Clarification:** The initial interactions focused on architectural dilemmas, specifically how to best structure the pipeline connecting the local classification model with the cloud-based summarization API. The AI assistant helped clarify the distinction and provided a foundational structure for the agent.
- **API and Environment Debugging:** A significant challenge involved resolving authentication errors with the Google Cloud and Generative AI APIs. The AI assistant was instrumental in diagnosing the root cause, providing a checklist of potential issues related to API key restrictions and environment variables, which led to a successful resolution.
- **Transition to Production Code:** Consultation was sought on transitioning the agent from a prototype using hard-coded inputs to a functional application. The AI provided guidance on implementing the OAuth 2.0 flow for the Gmail API, enabling the agent to process real, unread emails.
